**ABSTRACT:** The New York State Convicted Offender DNA Database is the first U.S. lab to complete an internal validation of the TrueAllele<sup>®</sup> expert data review system. TrueAllele<sup>®</sup> is designed to assess short tandem repeat (STR) DNA data based on several key features such as peak height, shape, area, and position relative to a standard ladder and use this information to make accurate allele calls. The software then prioritizes the allele calls based on several user-defined rules. As a result, the user need only review low-quality data. The validation of this system consisted of an extensive optimization phase and a large concordance phase. During optimization, the rule settings were altered to minimize the amount of high-quality data viewed by the user. In the concordance phase, a large dataset was typed in parallel with the ABI software GeneScan<sup>®</sup> and Genotyper<sup>®</sup> (manual review) and TrueAllele<sup>®</sup> (automated review) for comparison of allele calls and sample site assignment. Only one significant difference was discovered out of 2045 samples in the concordance study. In this case, TrueAllele<sup>®</sup> revealed a spike in the profile that was interpreted as a DNA peak by the analyst in Genotyper<sup>®</sup>. TrueAllele<sup>®</sup> was designed to focus the review on poor data and to eliminate the need for complete reanalysis technical review. This validation project proved TrueAllele<sup>®</sup> to be dependable for use at the NYSC Convicted Offender DNA Database.

---

Software Concept

A software tool that will provide...

- Data quality assessment
- Unattended parallel processing of multiple data inquiries.
- Access to the relevant data at any point in the analysis.
- Challenge to the software responses with alternative scenarios.
- Resolves mixtures
- Maximum information from the data

---

---

---

---

---

---

---

---

**Standard 3.2.2.**

- The laboratory must establish alternative criteria (e.g., quantitation values or use of a probabilistic genotype approach) for addressing potential stochastic amplification. The criteria must be supported by empirical data and internal validation and must be documented in the standard operating procedures.

- SWGDAM Interpretation Guideline for Autosomal STR Typing

---

---

---

---

---

---

---

Software Concept

A software tool that will provide...

- Data quality assessment
- Unattended parallel processing of multiple data inquiries.
- Access to the relevant data at any point in the analysis.
- Challenge to the software responses with alternative scenarios.
- Resolves mixtures
- Maximum information from the data
- Objective genotype inference for STR DNA patterns (including perpetrators contributing to mixtures).

**TrueAllele® Process Steps**

1. Data
2. Request
3. Solve
4. Review
5. Explain
6. Report

---

---

---

---

---

---

---

---

## Easy Mixture Case

- 50:50 Mixture Data
- One Unknown Contributor
- Victim Reference
- Suspect Reference

---

---

---

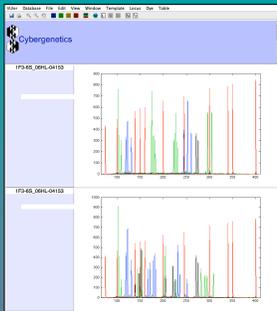

---

---

---

---

### 1. STR Evidence Data

---

---

---

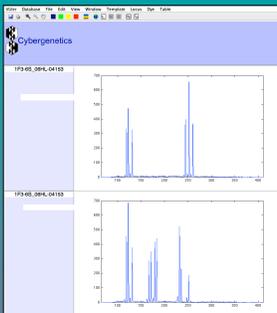

---

---

---

---

### 5-FAM Dye View

---

---

---

---

---

---

---

---

---

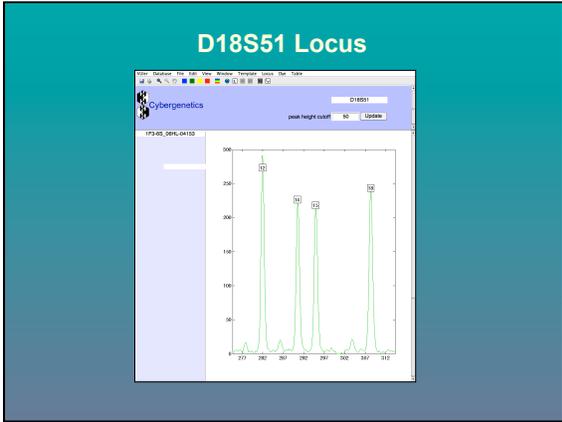

---

---

---

---

---

---

---

---

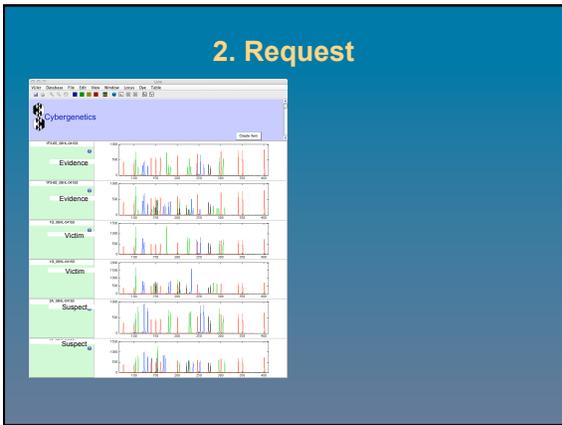

---

---

---

---

---

---

---

---

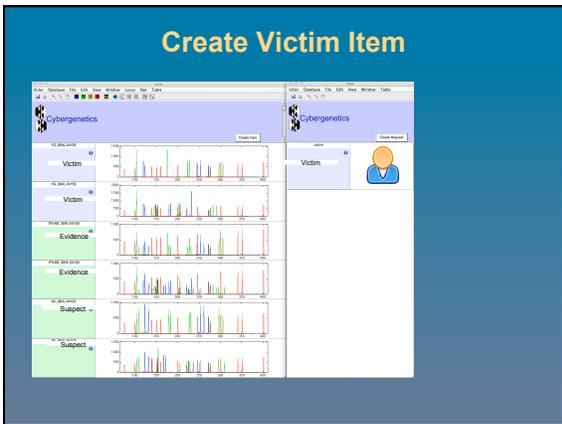

---

---

---

---

---

---

### Create Victim Request

The screenshot shows the 'Create Victim Request' workflow in the Cybergenetics software. It features three main panes. The left pane contains a grid of DNA profile plots for 'Victim' and 'Evidence' categories. The middle pane shows a 'Victim' profile with a person icon. The right pane shows a 'Victim' profile with a large blue 'V' icon.

---

---

---

---

---

---

---

---

### Create Evidence Request

The screenshot shows the 'Create Evidence Request' workflow in the Cybergenetics software. It features three main panes. The left pane contains a grid of DNA profile plots for 'Victim' and 'Evidence' categories. The middle pane shows an 'Evidence' profile with a DNA double helix icon. The right pane shows an 'Evidence' profile with a large blue '1' icon.

---

---

---

---

---

---

---

---

### Interpretation Requests

The screenshot shows the 'Interpretation Requests' workflow in the Cybergenetics software. It features three main panes. The left pane contains a grid of DNA profile plots for 'Victim', 'Evidence', and 'Suspect' categories. The middle pane shows profiles for 'Victim', 'Evidence', and 'Suspect' with person icons. The right pane shows profiles for 'Victim', 'Evidence', and 'Suspect' with large blue 'V', '1', and 'S' icons respectively.

---

---

---

---

---

### 3. Solving with TrueAllele

A photograph of the bronze statue 'The Thinker' by Auguste Rodin, sitting on a stone pedestal in a museum setting.

---

---

---

---

---

---

---

---

### Parallel Interpretation

A 4x4 grid of 16 small images of the 'The Thinker' statue, each showing a different perspective or lighting condition.

---

---

---

---

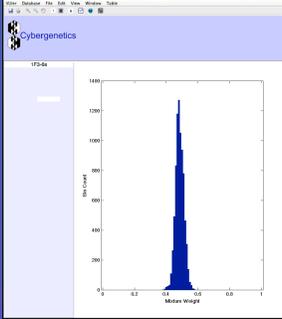

---

---

---

---

### 4. Review: Mixture Weight

A screenshot of a software interface titled 'Cybergenetics'. It displays a histogram of 'Mixture Weight' with a single prominent peak at 0.49. The y-axis is labeled 'Bin Count' and ranges from 0 to 1400. The x-axis is labeled 'Mixture Weight' and ranges from 0 to 1. The value '49%' is highlighted in yellow next to the peak.

---

### Interesting Mixture Case

- 65:35 Mixture Data
- Two Unknown Contributors
- No Victim Reference
- Suspect Reference

---

---

---

---

---

---

---

---

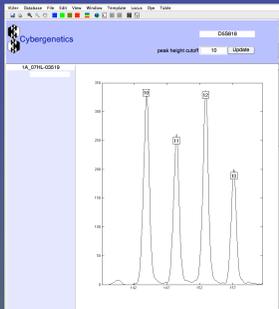

---

---

---

---

### Human Review: No Match Statistic

The STR DNA mixture profile from the blood stained swab of the trigger of the rifle (evidence item) is consistent with DNA from suspect 1 admixed with DNA from suspect 2.

**STATUS: EXPERT SYSTEM FUNCTIONS**

Without human intervention, the software

1. Identifies peaks, assigns allele designations
2. Performs lab-defined quality checks
5. Assigns mixture weights
6. Perform mixture deconvolution
7. Matches DNA patterns
8. Assigns statistics
9. Prepares reports
